

## Review Summary Entry [\(Roll over to view submission details\)](#)

### 1) Review Summary

There was a fair amount of discussion amongst the reviewers, and generally they all really like the work. However, the main issue is the scope and limitations of the work are not explicit. The changes that we'd like the authors to make are substantial enough that we think the revision cannot be made within a month, especially when we expect to shepherd the paper very closely.

### 2) Required Changes

- \* Use of "translational building blocks" in the title and rest of the paper.
- \* Inclusion of failure examples with detailed analysis of failure modes.
- \* Demonstration of technique on more non-facade examples, unless the claimed contribution is scaled down to facade-like images. If more non-façade examples were to be use, be explicit about the types that work.
- \* Comparison with representative images from Kwatra 2005, Simakov 2008, Pritch et al 2009, and especially He and Sun 2012 (since that work is also based on translational assumption). It is ok if they are failure examples.
- \* Demonstration of examples where the image is expanded by a fraction of the size of a building block.
- \* Expansion of the user study as described in the rebuttal to include a fair distribution of input images, especially using images from He and Sun 2012.
- \* Writing changes as promised in the rebuttal.
